

E-Sleeve

Wellvene's E-Sleeve is an electric line deployed and retrieved DHSV Hold Open Protection Sleeve, purposely designed to eliminate the need to rig up slickline for sleeve installation before conducting any e-line operations.

DESCRIPTION

On locating the TRSSSV No-Go, the E-Sleeves Snap-In Collet Fingers engage into the profile and securely hold the sleeve in position while the toolstring is minimally moved up and down. This allows the Running Tool indexing mechanism to rotate within the sleeve and then disengage, allowing toolstring continuation into the well while leaving the sleeve in situ within the nipple profile. On pulling out of hole, the running tool self-orientates back into the sleeve for retrieval to surface.

- Minimises intervention rig ups and runs
- Maximises operational efficiency
- Designed to suit any nipple profile size and type

FEATURES

- Available in two sizes - 4.500" and 5.500"
- Run and retrieved on E-Line
- Mechanically set and retrieved
- Snap in collet fingers to securely hold in position
- Designed to protect seal bores and hold TRSSSV flapper valve in open position
- Supplied with lifting clamp
