

Melon Equalising Assembly

The Wellvene Melon Equalising Housing is a widely adopted solution for achieving pressure equalization across a set plug. It features a straightforward equalizing melon that is positioned “on seat” in the sealed configuration, allowing for the conveyance of blanking plugs in a single run.

DESCRIPTION

Retrieving the Melon Equalising Housing can be activated in a single run utilising an equalising prong on the boom of a GS Pulling Tool, spaced out for a safe equalise/pull method. The melon can also be equalised in a dedicated run with an equalising prong to move the melon “off-seat”, while leaving the blanking plug in place.

The Melon Equalising Housing can be configured to allow a barrier to be deployed with the melon “off-seat” to allow fluid by-pass while RIH.

FEATURES

- Designed to suit specific operational requirements
- Available in a range of material specifications
- Compatible with all OEM or Wellvene Lock Mandrels and 3rd Party Bridge Plugs
