

N2 Filter Sub

The Wellvene N2 Filter Sub allows the operator to perform control line testing from the “production side” without the risk of pushing debris or well contents into the TRSSSV control line from the tubing.

DESCRIPTION

Used in conjunction with a Wellvene Lock Mandrel or WellVeX, our ported filter sub seals within the bottom seal bore of the TRSSSV and allows the operator to pressure up the tubing via platform supplied fluid or gas. Applied pressure through the Lock and Filter sub allows a test on the control line to be conducted and supports removal of any blockages within control line without allow well bore debris to migrate into the control line.

BENEFITS

- Ability to inject N2 directly into control line without introducing further debris into control line
- Enables the removal of potential blockages within the control line
- Easily set and retrieved into your existing TRSSSV sealbore
