

Pump Out Sub

The Wellvene Pump Out Sub offers remote equalising for nipple based blanking plugs and monobore bridge plugs.

DESCRIPTION

RIH in the closed position, the Pump Out Sub will provide a bi-directional barrier, allowing for pressure testing or the functioning of pressure activated completion equipment above the barrier.

When equalisation is required, pressure is applied via the wellbore from above and the Pump Out Sub will shear at a pre-determined rate. The well can be flowed through the lock or bridge plug body until a suitable opportunity arises to retrieve the entire system in one run.

The Pump Out Sub can also be equalised via mechanical means if required.

FEATURES

- Generous flow area post pump-out for flow type/circulating applications
- Streamlining wireline operations
- Debris tolerant design
- Retrofittable to adapt to existing lock mandrel/equalizing assemblies
- Variable setting options ranging from 500 psi minimum to 10,000 psi maximum in 500 psi increments
